

Disposable Totes are continuously wound from six to nine plies of thick A-flute corrugated in a patented process and

- **offers up to 25 tons of compression strength.**
- **eliminates the manufacturer's joint (the weakest part of a box), as well as any wood or metal parts.**

The result is a **seamless** container with superior stacking strength.

### **EASY ENVIRONMENTAL COMPLIANCE**

- Unlike steel and fiber drums, Disposable Totes are easily recyclable, completely biodegradable and waste-to-energy efficient.
- Unlike eight-sided corrugated IBCs, there are no staples or other metal parts to be removed.
- Unlike returnable totes, there are no high costs for cleaning and shipping empties.
